

DLN AI – Digital Learning Navigation

AI-Powered Workplace Productivity Assistant Project

Developed by: Dorothy Nhlapo

Programme: AI Skills Acceleration Programme (ASA 10)

Year: 2026

1. Personal Motivation

During the AI Skills Acceleration Programme, I noticed that many learners, including myself, often struggled to locate assignments, learning materials, announcements, and submission folders in Microsoft Teams. We frequently had to ask one another where resources were located, which interrupted learning and reduced productivity.

This experience inspired me to design DLN AI (Digital Learning Navigation). The goal was not to replace existing learning platforms but to create an intelligent AI assistant that helps learners and facilitators quickly find information, stay organized, automate repetitive tasks, and spend more time learning instead of searching.

2. Problem Statement

In today's digital workplace, professionals spend a significant amount of time performing repetitive administrative tasks such as writing emails, summarizing meeting notes, planning daily schedules, conducting research, and locating important documents.

Training organisations, NGOs, and bootcamps face an additional challenge: learners often struggle to find assignments, announcements, learning materials, and submission links across multiple communication channels. This leads to confusion, repeated questions, reduced productivity, and missed deadlines.

DLN AI addresses these challenges by providing an AI-powered workplace productivity assistant that automates common tasks while helping users easily access information and remain productive.

3. Solution Overview

DLN AI is a browser-based productivity assistant that combines twelve AI-powered productivity tools into a single, easy-to-use workspace.

The platform enables users to:

- Generate professional emails
- Summarize meeting notes
- Plan daily and weekly tasks
- Conduct AI-assisted research
- Manage assignments
- Access learning resources
- Track announcements
- Monitor productivity
- Receive intelligent guidance through the “I’m Lost” Assistant

The solution improves workplace productivity while supporting digital transformation within training organisations and NGOs.

4. Alignment with the AI Skills Acceleration Programme

This project demonstrates:

- Application of Artificial Intelligence in real workplace scenarios
- Effective Prompt Engineering techniques
- Responsible and Ethical AI practices
- Digital workplace automation
- Human-centered solution design
- Innovative problem solving
- Increased workplace productivity

5. Business Value

DLN AI improves workplace efficiency by reducing repetitive administrative work through AI-powered automation.

Key benefits include:

- Reduced time spent answering repetitive learner questions
- Faster communication through AI-generated emails
- Improved meeting follow-up with structured summaries

- Better task planning and prioritisation
- Faster access to learning materials
- Improved learner engagement
- Increased facilitator productivity
- Better collaboration across teams
- Improved digital learning experience
- Support for organizational digital transformation

6. Innovation

Unlike traditional productivity assistants, DLN AI has been designed specifically for learning environments.

Innovative features include:

- AI-powered “I’m Lost” Assistant
- Intelligent Announcement Assistant
- Research Assistant that generates:
 - Summaries
 - Flashcards
 - Quizzes

- Interview Questions
- Productivity Analytics Dashboard
- Assignment Navigation Assistant
- AI-generated reminders and notifications

These features reduce repetitive support requests while empowering users to work independently

Core Features — 12 Fully Functional Modules

Feature	What It Does
Dashboard	Stats widgets, overall progress tracker, AI recommendations, recent activity, quick actions
AI Chatbot	Conversational interface with quick suggestion prompts and step-by-step guided responses
Smart Email Generator	Recipient, tone, and purpose selectors; generates, edits, regenerates, and exports emails
Meeting Notes Summarizer	Drag-and-drop notes upload; extracts action items, decisions, and an executive summary
AI Task Planner	Daily, weekly, study, and meeting planning modes with time-blocking and an optimization score
Research Assistant	Accepts pasted text, uploads, or URLs; generates insights, plain-language explanations, quizzes, flashcards, and interview questions
Announcement Assistant	Extracts key dates, deadlines, and required actions, and flags priority level
Notification Center	Grouped, filterable alerts (new/all/read) with AI-suggested reminders
Assignment Hub	Filterable assignment list with deadline countdowns and a guided submission walkthrough
Learning Resources	Searchable resource library with AI summary, quiz, flashcard, and explain-it-simply tools
Productivity Analytics	Usage metrics, visual breakdowns, and streak/achievement tracking
‘I’m Lost’ Assistant	Always-available guided help that walks a user step-by-step to the right feature or resource

Tools Used

DLN AI was developed using modern web technologies and AI tools, including:

- HTML5
- CSS3
- JavaScript (ES6)
- Claude AI / ChatGPT APIs
- Responsive Web Design
- Glass morphism User Interface Design
- GitHub (Version Control)
- Lovable AI
- Prompt Engineering Techniques

Sample Prompts

Smart Email Generator

“Write a [tone] email to [recipient] regarding [purpose]. Keep it concise, action-oriented, and appropriate for a [audience] audience. Include a clear subject line and next steps.”

Meeting Notes Summarizer

“Summarize the following meeting notes into: (1) an executive summary in 3–4 sentences, (2) a table of decisions made, (3) a table of action items with owner and deadline. Notes: [pasted notes].”

Research Assistant

“Read the following content and provide: 3–5 key insights, 2–3 practical recommendations, and a plain-language explanation suitable for someone unfamiliar with the topic. Then generate a 5-question quiz. Content: [input].”

Responsible AI

- All AI-generated content (emails, summaries, plans) is clearly labeled as AI-generated and should be reviewed before use.
- AI is designed to assist users and not replace professional judgement or facilitator decisions.
- Users are encouraged to verify factual claims and deadlines extracted by the Research Assistant and Announcement Assistant before acting on them.
- No personal or sensitive data is required to use the core features; sample/demo data is used for the prototype.
- Known limitations include potential inaccuracies in AI-generated summaries and the possibility of AI bias in phrasing or prioritization, which is mitigated through human review before final use.

Challenges & Solutions

- Challenge: Keeping AI outputs consistent across 12 different features. Solution: standardized prompt templates per feature, with tone/context variables injected per user selection.
- Challenge: Ensuring users trust and understand AI-generated content. Solution: added visible AI-generated labels, edit/regenerate options, and a Responsible AI statement in Settings.

- Challenge: Supporting users unfamiliar with the tool. Solution: built the 'I'm Lost' floating assistant to provide step-by-step, empathetic guidance from anywhere in the app.

Future Enhancements

Future versions of DLN AI could include:

- Microsoft Teams Integration
- Google Classroom Integration
- Moodle Integration
- Calendar scheduling
- Voice-enabled AI Assistant
- Multi-language Support
- Predictive Analytics Dashboard
- Mobile Application

13. Conclusion

DLN AI demonstrates how Artificial Intelligence can be used responsibly to improve workplace productivity while supporting modern learning environments.

Inspired by a real challenge experienced during the AI Skills Acceleration Programmed, the solution combines twelve AI-powered productivity tools into a single platform that helps learners, facilitators and organisations reduce repetitive work, improve communication and increase productivity.

The project demonstrates practical AI implementation, prompt engineering, responsible AI principles, and innovative problem-solving aligned with today's digital workplace.
